Replacement actuator: 3914350924

## Special features / variants

(on request)

- With steel roller, various roller diameters
- Cranked or straight lever
- Different lever lengths
- Also available with following contacts:

3 NC contacts
2 NC / 2 NO contact

(3) © ©

Replacement actuator: $\mathbf{3 9 1 4 2 1 1 0 6 5}$

## Special features / variants

(on request)

- Available for high temperature range
- With following contacts:

3 NC contacts 2 NC / 2 NO contact
(larger enclosure)

## Limit Switch - Spindle-Mounted Lever

## Switching devices with spindle-mounted lever enclosure

On delivery, contact-making takes place in both pivot directions corresponding to the switching diagrams.

## Adaptation of basic actuator setting on spindle

The basic setting of the device can be varied in steps and fixed for exact positioning:

- AH, AHS, AHZ, AF, AD, AV:

Adjustment in steps of $15^{\circ}$ (Fig. 1)

- AHS-V:

Adjustment in steps of $7.5^{\circ}$ or $15^{\circ}$ (only here $\Theta$ ) by repositioning the intermediate piece (Fig. 2)

- Adaptation AV, AD:

Adjustment in radial direction

- AH, AHS, AHS-V, AHZ, AV: The roller levers can be used in a different axial actuating plane by repositioning by $180^{\circ}$ (Fig. 3 and 4)

## Adaptation of direction-independent switching function

With actuators AHS, AHS-V, AV, AD.

On delivery, contact-making takes place in both pivot directions corresponding to the switching diagrams. An idle function in the required pivot direction is achieved by simply repositioning the actuator cam (Fig. 5 and 6).

The idle function can be used in control systems that cannot process successive rebound pulses caused by oscillatory movement of extremely long AV/AD actuators.

## Positive opening action <br> Forward and return AHZ

For special safety applications, the positive opening action of the normally-closed contacts takes place both in forward (moving in one direction) as well as in return (moving back to home position) direction. For personal protection applications movement of the roller must be restrained in a guide block in both directions (Fig. 7 and 8).

Fig. 1

Fig. 5

Fig. 7

Fig. 8

Fig. 2

Fig. 4

Fig. 6

Note on changing actuators AH, AHS, AHS-V, AHZ, AF, AD, AV, DGH, DGK

The guaranteed as-delivered properties change when the actuation directions are adjusted and when actuators are repositioned by $90^{\circ}$.

The user himself must ensure that the device achieves safe operation for its intended purpose.

## Accessories for Insulation-Enclosed Limit Switches

The mounting plates help to prevent over-tightening and damage to the switch.

## Safety Switches with Separate Actuator

SKT

Safety switches with separate actuator are positive opening position switches. In terms of design, the switching element and actuator are separated. On actuation, the switching element and actuator are either brought together or separated. The positive opening NC contact is always open when the actuator is withdrawn. These switches are assigned to Type 2.

BERNSTEIN offers various versions of these Type 2 switches. The differences and advantages of the individual switch groups are outlined in the following.

The SKT is the smallest safety switch with a separate actuator. It is particularly suited for applications that require an extremely slim and short switch design. Its rotary head, two actuator openings and various switching functions underscore its versatility in extremely confined spaces.

Added to this, the SKT features other options to meet any requirements:

## - Integrated eject function (FE):

The actuator is ejected if the door is not locked securely. Consequently, the safety contact is opened, thus preventing the machine from starting up. In addition, this function makes it apparent that the door still needs to be locked.

## - Actuating force (up to $\mathbf{5 0} \mathbf{N}$ ):

The standard actuating force is 10 N . Depending on the switch variant, an actuating force of 50 N can also be selected. In many applications, hatches and doors need to be secured to prevent them being opened unintentionally. This is achieved by means of bolts, fasteners or other latching mechanisms. The SKI safety switch should be selected for applications requiring increased actuating force.

- Universal Hinged Actuator (MRU):

The MRU actuator is ideally suited for applications where the installation conditions severely restrict the actuating travel or radius. It has an adjustable actuating radius in the horizontal and vertical plane.

SKI

The SKI is the slimline version of a safety switch with a separate actuator. It is based on the BERNSTEIN 88 family. Its dimensions, not including the actuating head, correspond to EN 50047.

The actuating head is rotary mounted and has two actuator openings. The SKI safety switch is predestined for installation on section structures and in applications with confined installation conditions. Compared to the SKT, it offers more connection space for the wiring and variants with up to three switching contacts available.

Other advantages of this series include:

## - Integrated eject function (FE):

The actuator is ejected if the door is not locked securely. Consequently, the safety contact is opened, thus preventing the machine from starting up. In addition, this function makes it apparent that the door still needs to be locked.

## - Actuating force (up to $\mathbf{5 0} \mathbf{N}$ ):

The standard actuating force is 10 N . Depending on the switch variant, an actuating force of 50 N can also be selected. In many applications, hatches and doors need to be secured to prevent them from being opened unintentionally. This is achieved by means of bolts, fasteners or other latching mechanisms. The SKI safety switch should be selected for applications requiring increased actuating force.

## - Universal radius actuator (MRU):

The MRU actuator is ideally suited for applications where the installation conditions severely restrict the actuating travel or radius. It has an adjustable actuating radius in the horizontal and vertical plane.

## Safety Switches with Separate Actuator

SK

The SK safety position switch is an industry standard and can be used in virtually any application.

Thanks to design safety features conforming to VDE 0660 T200, IEC 60947-5-1 and the test regulations GS-ET 15, the SK is particularly suitable for personal protection applications. Its versatility is enhanced by the variable actuator head and two actuator openings.

Other decisive advantages include:

- Different actuating forces:

Corresponding to your specific application, in addition to the standard 10 N , you can also choose an actuating force of 5,20 or 30 N .
Actuating forces from 30 to 100 N can be realised with the aid of additional components that are mounted on the outside of the switch.

## - Anti-tamper facility:

The switching system is protected by multiple coding to ensure enhanced safety of your application.

## - Outstanding handling:

With the two slots you can easily adjust the SK safety switch and lock it in position by means of the two holes accessible from the top or the two holes accessible from the front. The switch can be wired from three different sides. A transparent cover prevents foreign particles from entering the contact space while connecting the power supply cable.

 Actuator: metal

## Technical data

## SKC

In terms of lengths, the SKC safety position switch is the 15 mm shorter variant of the SK. This makes it the right choice for confined installation conditions.

The SKC otherwise offers the same advantages as the SK: Industrial standard with particular emphasis on safety, personal protection and a variable actuator head with two actuator openings.

Other decisive advantages include:

## - Different actuating forces:

Corresponding to your specific application, in addition to the standard 10 N , you can also choose an actuating force of $5,20,30$ or 50 N .
Actuating forces from 30 to 100 N can be realised with the aid of additional components that are mounted on the outside of the switch.
